The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                exendin; extended-release formulation; plasma level; antidiabetic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Type: P Check: 7457

                                                                                                                                                                                                                                                                                                                                                  04-DEC-2003
                                                                                                                Synthetic
```

The invention relates to a novel pharmaceutical composition comprising an

Disclosure, SEQ ID NO 182; 173pp; English.

Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin agonist peptide in an extended-release formulation.

```
exendin (agonist) peptide in a extended-release formulation. The formulation is capable of releasing the peptide over a predetermined tenesase period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25t of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetees and conditions that would be benefited by inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Check: 7197
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  3302 Length: 38 February 4, 2005 13:33 Type: Pusing 'seq5' (mohamed337.key)

exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ADL66300 Length: 29 February 4, 2005 13:33 Type: P Check: 2313 Found using 'seq5' (mohamed337.key)

(AMYL-) AMYLIN PHARM INC.

Young AA, Kolterman OG; WPI; 2004-042706/04. Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation

Disclosure; SEQ ID NO 177; 173pp; English.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma splucese or delaying and/or slowing gastric empeying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.

anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
composition has antidiabetic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 exendin, extended-release formulation, plasma level, antidiabetic, anorectic, antilipaemic, diabetes, glucose, gastric emptying, inhibiting food intake, tolerance, obesity, hyperglycaemia,

```
exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25 anorectic, and antilipaemic activities. The novel composition and antichabetic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel pharmaceutical composition comprising an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure; SEQ ID NO 176; 173pp; English.

Sequence 32 AA;

The invention relates to a novel pharmaceutical composition comprising an exemdin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity,

Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                            Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                            Disclosure; SEQ ID NO 171; 173pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ADL66290;
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipsemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                        Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          exendin, extended-release formulation, plasma level; antidiabetic; anotilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition and method anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 gastric emptying or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 exendin; extended-release formulation; plasma level; antidiabetic;

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          exendin, extended-release formulation; plasma level, antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying;

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25$ of the pranhed release period. The composition has antidiabetic, an antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                             Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Type: P Check: 6326

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              exendin; extended-release formulation; plasma level; antidiabetic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Type: P Check: 9981

Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.

Disclosure; SEQ ID NO 165; 173pp; English

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ADL66285 Length: 28 February 4, 2005 13:33 Type: P Check: 326 Found using 'seq5' (mohamed337.key)

(AMYL-) AMYLIN PHARM INC.

Young AA, Kolterman OG;

WPI; 2004-042706/04.

Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.

Disclosure; SEQ ID NO 162; 173pp; English.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the postide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyshlpidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                           tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                        Pharmaceutical composition for treating diabetes, impaired glucose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       exendin; extended-release formulation; plasma level; antidiabetic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length: 28 February 4, 2005 13:32 Type: P Check: 596 9 'seq5' (mohamed337.key)

```
exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25* of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                      invention relates to a novel pharmaceutical composition comprising an
                                                                                                                                                                                                                                                                                         Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             . match found in sequence:
ad166274; Exendin agonist peptide, SEQ ID No 154.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25$ of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                             Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ADL66273;
  The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipsemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or carditovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Type: P Check: 1086
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       match found in sequence:

```
exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, ano antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                     The invention relates to a novel pharmaceutical composition comprising an

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25$ of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma alucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                           exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia;

Young AA,

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in a maount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 5 sg/ml is achieved for at least 2st of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by are useful in treating diabetes and conditions that would be benefited by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia;

```
Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        exendin; extended-release formulation; plasma level; antidiabetic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Synthetic
```

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperelycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.
                                                                                                                                                                                                                                Check: 183

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25$ of the predetermined release period. The composition has antidiabetic, anorectic, and antilibaente activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilippemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma alucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                       Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ADL66260 Length: 28 February 4, 2005 13:33 Type: P Check: 191

Pharmaceutical composition for treating diabetes, impaired glucose

(AMYL-) AMYLIN PHARM INC. Young AA, Kolterman OG;

WPI; 2004-042706/04

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma alucose or delaying and/or slowing gastric emperying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       exendin; extended-release formulation; plasma level; antidiabetic;

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capble of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, of the predetermined release period. The composition and method anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                              Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 exendin; extended-release formulation; plasma level; antidiabetic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Length: 28 February 4, 2005 13:33 Type: P Check: 419 og 'seq5' (mohamed337.key)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ADL66258
```

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                               Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      exendin; extended-release formulation; plasma level; antidiabetic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ADL66259 Length: 28 February 4, 2005 13:33 Type: P Check: 630 Found using 'seq5' (mohamed337.key)

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                      Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           exendin; extended-release formulation; plasma level; antidiabetic;

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in a macunt such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence
                                                                                                                                                                                                                                                                                                                  Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; carditovascular.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                     exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Disclosure; SEQ ID NO 134; 173pp; English.

Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.

Disclosure; SEQ ID NO 135; 173pp; English

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined trelease period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25t of the predetermined release period. The composition has antidiabetic, of the predetermined antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.

                                     The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25 g of the predetermined release period. The composition has antidiabetic, anorectic, and antilipsemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                       exendin; extended-release formulation; plasma level; antidiabetic;
                                                                                                                                                                                                                                                                                                   anorectic; antilipaemic; diabetes; glucose; gastric emprying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Type: P Check: 131

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by
                                          tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
Pharmaceutical composition for treating diabetes, impaired glucose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Length: 28 February 4, 2005 13:32 Type: P Check: 482 ig 'seq5' (mohamed337.key)

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    exendin; extended-release formulation; plasma level; antidiabetic; ancilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.
                                                                                                                                                Check: 492
represents an exendin agonist peptide of the invention.
                                                                                                                                                Type: P
                                                                                                                                                                                                                                                                                                                                                                                                                                       1 match found in sequence:
adl66250 ; Exendin agonist peptide, SEQ ID No 130.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emperying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation
                                                                                                                                                                                                                                 exendin; extended-release formulation; plasma level; antidiabetic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 570
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Check:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2005 13:32 Type: P

that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 exendin, extended-release formulation, plasma level, antidiabetic, anorectic, antilipaemic, diabetes, glucose, gastric emptying, inhibiting food intake, tolerance, obesity, hyperglycaemia, dyslipidaemia, cardiovascular.

The invention relates to a novel pharmaceutical composition comprising an exendia (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic,

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma alucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence
and antilipaemic activities. The novel composition and method in treating diabetes and conditions that would be benefited by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation
                                    lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 exendin, extended-release formulation, plasma level, antidiabetic, anorectic, antilipaemic, diabetes, glucose, gastric emptying, inhibiting food intake, tolerance, obesity, hyperglycaemia,

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipsemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention. exendin or an exendin agonist peptide in an extended-release formulation. Disclosure; SEQ ID NO 125; 173pp; English.

Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.

Disclosure; SEQ ID NO 126; 173pp; English.

The invention relates to a novel pharmaceutical composition comprising an

exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, ancetic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.

Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation

Disclosure, SEQ ID NO 127; 173pp; English.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such

WPI; 2004-042706/04.

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                           Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             exendin; extended-release formulation; plasma level; antidiabetic; ancrectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia;

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, and antilipaemic activities. The novel composition and method anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                              tolerance, obesity, dyslipidemia or cardiovascular disease comprises an
exendin or an exendin agonist peptide in an extended-release formulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an

The invention relates to a novel pharmaceutical composition comprising an extendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25* of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by
                                                                                                                                                                                                                                                                                                                     Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              exendin; extended-release formulation; plasma level; antidiabetic; antilipsemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ADL66243;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                            Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          exendin; extended-release formulation; plasma level; antidiabetic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ADL66241 Length: 28 February 4, 2005 13:32 Type: P Check: 663 Found using 'seq5' (mohamed337.key)

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma alucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation
                                                    exendin; extended-release formulation; plasma level; antidiabetic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ADL66239 Length: 28 February 4, 2005 13:33 Type: P Check: 546 Found using 'seq5' (mohamed337.key)

Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.

Disclosure; SEQ ID NO 120; 173pp; English.

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25 agonic the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by the composition and method are useful and antilipaemic activities.
                                                                                                                                                                                                                                                                                     lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    exendin; extended-release formulation; plasma level; antidiabetic; ancetic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolorance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           extendin; extended-release formulation; plasma level; antidiabetic; annorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Type: P Check: 683

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25 go of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pharmaceutical composition for treating diabetes, impaired glucose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Check: 244

Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.

Disclosure; SEQ ID NO 115; 173pp; English.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilippemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention

are useful in treating diabetes and conditions that would be benefited lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impairzed glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia;
                                                                                                                                                                                                                                                                                                                                                 2005 13:32 Type: P Check: 251

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25 to the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                       exendin; extended-release formulation; plasma level; antidiabetic; ancrectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ADL66234 Length: 28 February 4, 2005 13:33 Type: P Check: 156 Found using 'seq5' (mohamed337.key)

```

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention. Disclosure, SEQ ID NO 110; 173pp; English.

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
            Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.

The invention relates to a novel pharmaceutical composition comprising an formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in a macount such that, when the composition is administered to a human, an awerage sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation. represents an exendin agonist peptide of the invention Disclosure; SEQ ID NO 106; 173pp; English. 28-MAY-2003; 2003WO-US016699 28-MAY-2002; 2002US-00157224 (AMYL-) AMYLIN PHARM INC. Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation

Disclosure; SEQ ID NO 107; 173pp; English

The invention relates to a novel pharmaccutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25 of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglyvaemia, dyalipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                         Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia;

```
exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipsemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   invention relates to a novel pharmaceutical composition comprising an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                  exendin; extended-release formulation; plasma level; antidiabetic; antilipaemic; diabetes; glucose; gastric emprying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        represents an exendin agonist peptide of the invention

Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.

Disclosure; SEQ ID NO 103; 173pp; English.

exendin (agonist) peptide in an extended release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25* of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention. The invention relates to a novel pharmaceutical composition comprising an

Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.

Disclosure; SEQ ID NO 99; 173pp; English.

exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25* of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention. The invention relates to a novel pharmaceutical composition comprising an

```

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, of the predetermined ancients error of the predetermined ancients and ordering lasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyalipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia;

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma alucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                          Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     exendin; extended-release formulation; plasma level; antidiabetic; antolipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ADL66210;
```

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                        Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                exendin; extended-release formulation; plasma level; antidiabetic;

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma alucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.
          exendin; extended-release formulation; plasma level; antidiabetic; antilipaemic; diabetes; glucose; gastric emprying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Type: P Check: 7463
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               adl66208; Exendin agonist peptide, SEQ ID No 88. The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gateric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyalipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                         Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ADL66208 Length: 30 February 4, 2005 13:33 Type: P Check: 4886 ound using 'seq5' (mohamed337.key)

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in a mount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25$ of the predetermined release period. The movel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obssity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Type: P Check: 4125
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          represents an exendin agonist peptide of the invention.

```

Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.

Disclosure; SEQ ID NO 86; 173pp; English.

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25 of the predetermined release period. The composition has antidiabelic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by
                                                                                                                                                                                                                                                                                                                     lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Check: 869
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Type: P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     match found in sequence:

```
the invention capable of releasing the peptide over a predetermined formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyglipidaemia or cardiovascular disease. ```
exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anoancetic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel pharmaceutical composition comprising an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Check: 4125

adl66202 ; Exendin agonist peptide, SEQ ID No

```
Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                        exendin; extended-release formulation; plasma level; antidiabetic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.
        adl66201; Exemdin agonist peptide, SEQ ID No 81.

```

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.

Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.

Disclosure; SEQ ID NO 79; 173pp; English.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25 soft the predetermined release period. The composition and mathiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention

Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.

Disclosure, SEQ ID NO 80, 173pp, English.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined trelease period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 254 of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.

Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.

Disclosure; SEQ ID NO 78; 173pp; English.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                     Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ADL66193 Length: 33 February 4, 2005 13:33 Type: P Check: 2325 ound using 'seq5' (mohamed337.key)

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined tralease period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyalipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                     Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ADL66192;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               exendin; extended-release formulation; plasma level; antidiabetic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.

```

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma splucese or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.

```
exendin (agonist) peptide in an extended release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel pharmaceutical composition comprising an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                            exendin; extended-release formulation; plasma level; antidiabetic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipideemia; cardiovascular.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SXB
                                                 The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperelycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                             exendin; extended-release formulation; plasma level; antidiabetic; anotilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Type: P Check: 333

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition and mathod and natilipaemic activities. The novel composition and mathod are useful in treating diabetes and conditions that would be benefited by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       exendin, extended-release formulation, plasma level, antidiabetic, anorectic, antilipaemic, diabetes, glucose, gastric emptying; inhibiting food intake, tolerance, obesity, hyperglycaemia;
                                                                                                                                                Check: 5894
represents an exendin agonist peptide of the invention.
                                                                                                                                                    Type: P
                                                                                                                                                                                                                                                                                                                                                                                                                                                  match found in sequence:
ad166184; Exendin agonist peptide, SEQ ID No 64.

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25$ of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                           exendin, extended-release formulation, plasma level, antidiabetic, anorectic, antilipaemic, diabetes, glucose, gastric emptying, inhibiting food intake, tolerance, obesity, hyperglycaemia, dyslipidaemia, cardiovascular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Check: 2854

formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, and antilipaemic activities. The novel composition has antidiabetic, are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or linhibiting food intake, such as impaired glucose tolerance, obseity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.

Young AA, Kolterman OG;

WPI; 2004-042706/04.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation Disclosure; SEQ ID NO 62; 173pp; English.

```
anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.

Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation

Disclosure; SEQ ID NO 63; 173pp; English.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in a mount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25 g of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma alucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25¢ of the predetermined release period. The composition has antidiabetic, ancectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel pharmaceutical composition comprising an
                                                                                                                                                                                                                  Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         exendin; extended-release formulation; plasma level; antidiabetic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25 of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by
                                                                                                                                                                                                                                                                                                                                                                                                             Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 lowering plasma glucoše or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ADL66176 Length: 28 February 4, 2005 13:32 Type: P

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ADL66177;
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          exendin, extended-release formulation, plasma level, antidiabetic, anorectic, antilipaemic, diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ADL66175 Length: 28 February 4, 2005 13:33 Type: P Check: 9921 Found using 'seq5' (mohamed337.key)

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipsemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma alucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation
                                                                                                                                                                                                                                 exendin, extended-release formulation, plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ADL66173 Length: 28 February 4, 2005 13:33 Type: P Check: 193 Found using 'seq5' (mohamed337.key)

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25 to the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impatred glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia;

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least .25% of the predetermined release period. The composition has antidiabetic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                  exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia;

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 15$ of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                   exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      l match found in sequence:
ad166173; Exendin agonist peptide, SEQ ID No 53.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma alucese or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             exendin, extended-release formulation, plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia;

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 55 of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by are useful.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                    exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emprying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.

Sequence 28 AA

Fri Feb

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucese or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention \$

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25 the predetermined release period. The composition has antidiabetic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or
sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, annorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or linhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.
                                                                                                                                                                                                                                        63
                                                                                                                                                                                                                                    ADL66167 Length: 28 February 4, 2005 13:33 Type: P Check: Found using 'seq5' (mohamed337.key)

Pharmaceutical composition for treating diabetes, impaired glucose

tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation

Disclosure; SEQ ID NO 45; 173pp; English.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslighaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.

 The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                   Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               exendin; extended-release formulation; plasma level; antidiabetic;

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      exendin; extended-release formulation; plasma level; antidiabetic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Check: 166

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in a maount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25$ of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hypexglycaemia, dyslipidaemia or cardiovascular disease. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia;

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25 the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperelycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                    Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   exendin; extended-release formulation; plasma level; antidiabetic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food inteke; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperelycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                    formulation; plasma level; antidiabetic;
                                                                 anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.
                                                                                                                                                                                                                                                         /note= "C-terminal amide"

20-MAY-2004 (first entry)

Exendin agonist peptide, SEQ ID No 39.

```
Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin agonist peptide in an extended-release formulation.
extended-release formulation; plasma level; antidiabetic;
                        anorectic; antilipaemic; diabetes; glucões; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.

```

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/m is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ADL66157 Length: 39 February 4, 2005 13:33 Type: P Check: 706 Found using 'seq5' (mohamed337.key)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 adl66158 ; Exendin agonist peptide, SEQ ID No 38. The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25$ of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           lowering plasma glucoëe or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exemila agonist peptide of the invention.
                                                                                                                                            exendin; extended-release formulation; plasma level; antidiabetic; antilipaemic; diabetes; glucose; gastric emprying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.

Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin agonist peptide in an extended-release formulation

Disclosure; SEQ ID NO 35; 173pp; English.

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ADL66155 Length: 39 February 4, 2005 13:33 . The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Check: 458

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25 to the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ADL66153 Length: 39 February 4, 2005 13:32 Type: P Check: 706 ound using '8eq5' (mohamed337.key)

(AMYL-) AMYLIN PHARM INC.

Kolterman OG; foung AA,

WPI; 2004-042706/04.

Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.

Disclosure; SEQ ID NO 30; 173pp; English.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25\$ of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma alucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.

formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an aworage sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dysllpidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel pharmaceutical composition comprising an

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                    exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.

formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, are useful in treating diabetes and conditions that would be benefited are useful in treating diabetes and conditions that would be benefited by inhibiting food intake, such as impaired glucose tolerance, obesity, hyperelycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.

Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation Disclosure; SEQ ID NO 26; 173pp; English.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic,

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predecermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25$ of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or
anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obssity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 exendin; extended-release formulation; plasma level; antidiabetic; anorectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.

Disclosure; SEQ ID NO 24; 173pp; English.

exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25¢ of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention. to a novel pharmaceutical composition comprising an tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation exendin, extended-release formulation, plasma level, antidiabetic, anorectic, antilipaemic, diabetes, glucose, gastric emptying, inhibiting food intake, tolerance, obesity; hyperglycaemia; Pharmaceutical composition for treating diabetes, impaired glucose Check: 9299 Length: 39 February 4, 2005 13:33 Type: P g 'seq5' (mohamed337.key) adl66144; Exendin agonist peptide, SEQ ID No 24. The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Young AA,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ADL66145;
```

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma alucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                      Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         exendin; extended-release formulation; plasma level; antidiabetic;

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipideemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                               Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  exendin; extended-release formulation; plasma level; antidiabetic; ancrectic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.

The invention relates to a novel pharmaceutical composition comprising an extendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by are useful.
                                                                                                                                                                                                                                                                                                                                                                                                                                Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               exendin, extended-release formulation, plasma level, antidiabetic, anorectic, antilipaemic, diabetes, glucose, gastric emptying, inhibiting food intake, tolerance, obesity, hyperglycaemia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 match found in sequence:
adl66139 ; Exendin agonist peptide, SEQ ID No 19.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ADL66139;
       The invention relates to a novel pharmaceutical composition comprising an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in a meount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilippemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   exendin; extended-release formulation; plasma level; antidiabetic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Type: P Check: 9571
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       . match found in sequence:
ad166138 ; Exendin agonist peptide, SEQ ID No 18.
